

Sequelize CLI Commands

[Click to toggle options.](#)

```
// install sequelize cli globally
```

```
npm install -g sequelize-cli
```

If you are getting permission denied then use the following command:

```
sudo npm install -g sequelize-cli
```

```
// install the sequelize package for your app.
```

```
npm install sequelize pg --save
```

```
// this will initialize sequelize and create config, migrations, seeders and models // folders
```

```
sequelize init
```

Edit config/config.json. **The dialect should be "postgres"**

```
// run migration to create/update schema of your tables
```

```
sequelize db:migrate
```

```
// creating a model
```

```
sequelize model:create --name User --attributes 'name:string email:string bio:text'
```

After creating the model always run sequelize db:migrate so model can be used to create a table.

Creating a new migration

```
sequelize migration:create --name 'nameofthemigration'
```
